1 About This Document

This document contains information pertaining to the latest version of the Photon Phresco Framework 3.2

2 Features & Functionality

- Build Versioning; Assign unique version numbers to the projects during project creation. Use the version number category (Major, Minor) to identify the project version created. The build type can be classified based on an iteration, sprint or date.
- Multi module Support
- Create a new branch/trunk from an existing branch
- Create a new software tag
- Deploy the build directly in the desired environment.
- Separate Source files, .Phresco & .Test

3 Known Issues

- Functional test do not run for split projects(all technologies except widgets and J2EE)
- Create tag and release operations are not available for JQuery widgets(Split project)
- For Imported projects, release operation into source repo of repository tab are not available
- Duplicate names are being allowed during branch & tag creation and the duplicate branch is created inside the already created branch in the name of "trunk"
- Password details are visible in console while creating a new tag in Git
- Project created within a branch in the source repo of repository tab(with "Download to workspace" option enabled) is not added to the repo but is available in /workspace/projects folder
- Newly created branch and tag details are not visible in the UI
- Functional Framework archetypes do not auto populate on selecting the concerned framework in the UI
- Remote deployment fails for JBOSS 5 Enterprise edition
- Copy to Clip Board option does not work in some tabs
- Unable to release the branch in build versioning for multi module project
- Build and PDF reports cannot be downloaded from CI
- "Kill Process" does not work as expected
- Build versioning feature does not work as expected for the migrated projects
